Advocating for a data-centric decision-making process to mitigate climate risks

On the occasion of World Environment Day, the World Trade Center Jaipur and CNC Infotech organized a seminar titled "Assessing the Environmental Friendliness of Globally Traded Products".

The Guest of Honour, Mr. Madhu Sudan Dadich, a Social Engineer and Environmentalist from Jaipur, addressed the audience, stating, "Climate change is a pressing concern today. In recent years, the issue has gained significant attention. Greenhouse gases are the primary cause of climate change, leading to various adverse effects such as glacier melting, unpredictable seasonal changes, and other natural disasters. It is crucial to replace disposable items with reusable ones, minimize paper use, save electricity, practice recycling, and make concerted efforts to conserve natural resources."

In his welcome address, Mr. Manish Dhameja, Director of CNC Infotech Skill Development Pvt. Ltd., Jaipur, highlighted the role of information technology in environmental conservation. He said, "Information technology can be used to collect and analyze data on various environmental factors such as water, soil, and air quality, land contamination, and the presence of pests and diseases. This information can help identify potential health risks and guide efforts to mitigate them."

Participants raised questions on several global environmental issues, including global warming, ozone layer depletion, solid waste management, and deforestation.

Mr. Navneet Agarwal, Assistant Director of the World Trade Center Jaipur, proposed a vote of thanks. The event concluded with a tree plantation drive, involving all participants and guests of honour.

The event was held on June 05, 2024 at CNC Towers, Jaipur, Rajasthan.
